SHARK BODY PARTS

Dorsal Fin – The fin on top of the shark's body that keeps it steady while swimming.

Gills – Slits on the sides of the shark's head that help it breathe underwater.

Pectoral Fins – These fins are on the sides near the head. They help the shark steer and balance.

Tail (Caudal Fin) – The tail fin helps push the shark forward through the water.

Eyes – Sharks can see very well, even in the dark depths of the ocean.

Teeth – Sharks have multiple rows of sharp teeth, and they can grow new ones throughout their lives!

SHARKS CAN SENSE MOVEMENT AND VIBRATIONS IN THE WATER WITH THEIR SPECIAL FINS AND SKIN.
